

For immediate release

Yonac Releases AirVox, First Touchless Gesture Controlled Music Application

Using cutting-edge Computer Vision technology, Yonac introduces a new way to create art on iOS devices.

(Durham, NC – July 26, 2011) Yonac Software is pleased to announce the release of AirVox – Gesture Controlled Music for iOS. AirVox is the first touchless gesture controlled application to employ highly precise Computer Vision technology for mobile devices. Computer Vision is the emerging study of enabling machines to see.

“You don’t need a keyboard, fretboard, or touchscreen to make music,” says company founder Jim Yonac. “All you need is your own hands.” These revolutionary control methods, combined with AirVox’s ease of use, allow anyone to start making music immediately. The right hand controls the pitch, while the left hand controls the selected sound parameter (such as volume or vibrato rate). AirVox utilizes the front-facing camera and is only compatible with the iPhone 4, iPad 2, and iPod Touch 4th Gen. It is available now in the iTunes store for \$2.99 USD.

Yonac Software was founded in New York City in 2008. The company mainly focuses on the development of innovative music and sound related software. In 2008, Yonac released miniSynth, the very first synthesizer for the iPhone. Yonac’s other iOS applications include miniSynth PRO, Thereminator, Pitchbot, and miniDrum PRO.
